Coinbase's Invisible Business: The Developer Platform That 270 Enterprises Are Already Using*

The CDP, Institutional Infrastructure, and the AWS Parallel Nobody Is Quantifying

Onchain infrastructure | Unit economics

THE SHORT VERSION

Coinbase's developer platform serves 270+ enterprise clients — Citi, JPMorgan, BlackRock, Stripe, PayPal, Revolut, Shopify — and 150+ government agencies. Brian Armstrong has used the AWS analogy explicitly: an infrastructure layer that financial services companies plug into, the way cloud companies plugged into Amazon. The FY2025 operating metrics suggest the thesis is already materializing.

And yet the models I've come across don't have a dedicated revenue line for the CDP. The revenue flows into two catch-all segments and disappears.

ILLUSTRATIVE EXERCISE

This is a **demonstrative modelling exercise**, written to show a method: how the numbers are built, which assumptions carry the answer, and where the disclosure gaps are. It is **not a price target, not a recommendation, and not a view on the security**. Any valuation range shown is an output of the stated assumptions, not a judgement about what the shares are worth. See the full disclosure.

What the CDP Is

The Coinbase Developer Platform is Coinbase's institutional infrastructure offering: APIs, custody solutions, blockchain connectivity tools, and compliance frameworks that let enterprises and government agencies integrate crypto functionality without building their own stack from scratch.

The CDP includes Coinbase Prime (institutional prime brokerage and custody), the Coinbase Cloud developer API suite, the Coinbase Wallet SDK, and Base infrastructure access. It's the interface through which a payments company adds crypto acceptance, a bank adds digital asset custody, or a government agency settles cross-border payments on a blockchain. The business model is API-based and custody-fee-based: enterprises pay on transaction volume, on assets under custody, or on fixed platform access fees depending on their product configuration.

The Client List and What It Actually Implies

JPMorgan, Citi, and BlackRock are not proof-of-concept clients. They are fully operational financial institutions with compliance, legal, and technology requirements that took months or years to satisfy before any integration was approved. Their presence on the CDP client list is evidence of a deep commercial relationship, not a logo on a press release.

The October 2025 Citi partnership is the most significant recent disclosure: Coinbase announced collaboration with Citi to develop digital asset payment solutions, representing one of the largest global banks integrating Coinbase's infrastructure into its payments stack. That partnership alone implies significant custody and transaction infrastructure usage — none of which is separately disclosed in revenue.

The **150+** government agency clients span multiple continents and use cases including central bank digital currency pilots, cross-border settlement projects, and digital asset policy research. These are long-cycle, compliance-intensive relationships. They represent recurring contractual infrastructure revenue, not one-time project fees.

The Revenue Opacity Problem

Every dollar of CDP revenue is buried inside either "Other Transaction" ($**252.9**M, +**20%** YoY in FY2025) or "Other Sub & Services" ($**554.8**M, +**30%** YoY). Neither line has a sub-breakout in any public filing.

This opacity is deliberate. Disclosing CDP revenue in detail would reveal client-level economics to competitors — primarily Fireblocks, BitGo, and emerging bank-built alternatives. The strategic benefit of opacity outweighs the investor communication cost.

It's also exactly what Amazon did with AWS for the first several years of the business, before the revenue scale made continued consolidation untenable.

Platform Scale as a Revenue Proxy

In the absence of direct disclosure, platform metrics are the best available proxy for CDP scale.

FY2025 trading volume: $**5.2**T, up **156%** YoY — including institutional activity routed through Coinbase Prime and the CDP. Total assets on platform: $**516**B as of Q3 2025. Monthly transacting users: **9.2**M. Coinbase's share of total crypto trading volume doubled to **6.4%**.

At institutional custody fee rates of **0.5**-**1.5**bps applied to $**516**B in platform assets, implied custody fee revenue alone ranges from $**258**M to $**774**M annually — a range that substantially overlaps with the combined catch-all lines. Even the low end of that range would make the CDP the second-largest revenue segment in the business. The disclosed custodial fee revenue line ($**198.2**M, +**40%** YoY in FY2025) is almost certainly a partial view of total custody economics — likely excluding API and platform access revenue classified elsewhere.

The AWS Analogy: Taking It Seriously

AWS captured approximately $25B in revenue by FY2019 — roughly 12% of Amazon's total — before achieving the market recognition that drove Amazon's multiple expansion. At $7.2B in Coinbase total revenue, a business at 12% revenue share implies approximately $860M in CDP revenue. That figure is within the plausible range of the catch-all lines.

The question isn't whether the analogy is aspirational. It's whether the disclosure cadence ever catches up to the business reality.

What to Watch

Any earnings call comment referencing CDP client count, CDP revenue as a percentage of Other Transaction, or disclosed per-client economics should be treated as highly analytically material. The disclosure of AWS revenue as a separate segment in 2015 — after years of consolidation — was a revaluation event for Amazon. A similar disclosure decision by Coinbase could reprice the Other Transaction and Other Sub & Services multiples immediately.

Watch also for Citi, JPMorgan, or BlackRock disclosures in their own earnings calls about digital asset infrastructure partnerships. Any quantification by the client side provides an indirect read on CDP economics.
